2. Summarize your data:

Film Table: Numeric

The screenshot shows a database interface with a query editor and a results table. The query is a SELECT statement that calculates various aggregate statistics for the 'film' table. The results table displays the output of this query, showing a single row of data.

Query:

```
1 SELECT MIN (release_year) AS min_release_year,
2 MIN (rental_duration) AS min_rentdur,
3 MIN (rental_rate) AS min_rate,
4 MIN (length) AS min_leng,
5 MIN (replacement_cost) AS min_replac,
6 MAX (rental_duration) AS max_rate,
7 MAX (length) AS max_leng,
8 MAX (replacement_cost) AS max_replac,
9 AVG (release_year) AS avg_release_year,
10 AVG (rental_duration) AS avg_rentdur,
11 AVG (rental_rate) AS avg_rate,
12 AVG (length) AS avg_leng,
13 AVG (replacement_cost) AS avg_replac
14 FROM film
```

Data Output:

	min_release_year integer	min_rentdur smallint	min_rate numeric	min_leng smallint	min_replac numeric	max_rate smallint	max_leng smallint	max_replac numeric	avg_release_year numeric	avg_rentdur numeric	avg_rate numeric
1	2006	3	0.99	46	9.99	7	185	29.99	2006.0000000000000000	4.9850000000000000	2.9800000000000000

Film Table - Non Numeric

Movie Rating

The screenshot shows a database interface with a query editor and a results table. The query is a SELECT statement that calculates the average rating for each movie, ordered by rating in descending order, and limited to the top 1 result. The results table displays the output of this query, showing a single row of data.

Query:

```
1 SELECT rating AS rating_lang
2 FROM (
3 SELECT rating, COUNT(*) AS rating_count
4 FROM film
5 GROUP BY rating
6 ORDER BY rating DESC
7 LIMIT 1
8 ) AS mode_subquery;
```

Data Output:

	rating_lang mpaa_rating
1	NC-17

Language

Rockbuster/postgres@PostgreSQL 14

Query Query History

```
1 SELECT language_id AS most_lang

1. How would you clean each set of data?

- A. **Missing Data:** Save Data, then you'll want to use the 'SELECT' statement to omit any columns you'd like to skip over when checking this data (make note in query). You can also use the 'Impute' or fill in where there are missing sections of the data.
- B. **Duplicate Data:** First and foremost, backup your data before starting to edit the query. Then use the 'Group By' function to identify the records that you want to check in a specific column of the data. Then, if duplicates are found, use the 'Delete' statement to remove any information in the set that is invalid or 'Merge' multiple statements into one single record by using the 'update' function to join the multiple sections you'd like to combine.
- C. **Non-Uniformed Data:** After saving your data, use the GROUP By and DISTINCT functions to check a few areas in your data to see if your outputs have any inconsistencies. If you find areas that need to be uniformed use the

UPDATE (name of data set)

SET (section you'd like the format to change FROM) = (section name you'd like the area to be formatted TO)

WHERE (column) IN (section you'd like the format to change FROM)

3 - Back in Achievement 1 you learned about data profiling in Excel. Based on your previous experience, which tool (Excel or SQL) do you think is more effective for data profiling, and why? Consider their respective functions, ease of use, and speed. Write a short paragraph in the running document that you have started.

Because both systems have different functions it's important to first consider how large the data sets you're looking at are. If this is a task that only one or two people are looking at altering any type of data within the spreadsheet. While SQL is more practical for large amounts of data across a range of multiple operations and avenues within a business, company, or program. SQL is better for tasks that require the data to alter and change into migrating into one system format rather than keeping it in a spreadsheet format. Personally, because I am more familiar with spreadsheets, it is more comfortable and easier for me to profile data when Excel and more familiar with using functions such as filter, pivot tables, and highlighting to more clearly see where information might need to be altered.
